Name of Tool:	Pre Post Inventory (PPI)
Author/Publisher (Year)	Behavior Data Systems

Description:	
	The Pre-Post Inventory provides an objective outcome measure for evaluating intervention, counseling or treatment effectiveness. The same test is administered twice-- the pretest (before treatment) serves as a baseline against which the posttest (after treatment) is compared. The Pre-Post Inventory has 161 items that make up seven scales (measures) include: • Truthfulness Scale • Alcohol Scale • Drug Scale • Self-Esteem Scale • Anxiety Scale • Depression Scale • Distress Scale • Stress Management Scale Scores are used to classify risk into four categories: • Low Risk • Medium Risk • Problem Risk and • Severe Problem These classifications, along with clinical judgment, are used to inform treatment recommendations. Truthfulness Scale detects offender denial, problem minimization, and response bias. Demonstrated reliability and validity.
Tool Development	
	Summary of scientific findings are available for download.
General Notes:	
	PPI is a computerized assessment that provides clinicians with a printed report that includes percentile scores, risk classification, and item responses. The PPI takes 30 minutes to complete. Tests can be administered individually or in group settings.
