

Name of Tool:	Outpatient Screen (OPS)
Author/Publisher (Year)	Lindeman/Behavior Data Systems Ltd.

Description:	<ul style="list-style-type: none"> • The OPS is a 152-item, self-report computer scored test designed to enable early identification of psychological problems like anxiety, depression, poor self-esteem, substance (alcohol/drug) use and stress management issues. • The items comprised 8 scales: (1) truthfulness scale, (2) anxiety scale, (3) depression scale, (4) alcohol scale, (5) drug scale, (6) substance use, (7) self-esteem scale, and (8) stress management scale. • Percentile scores are used for risk classification “Low Risk,” “Moderate Risk,” “Problem Risk,” and “Severe Problem”. • Risk classifications, along with clinical judgement, are used to inform treatment recommendations. • Truthfulness Scale detects offender denial, problem minimization, and response bias. • Test administered requires 25 to 30 minutes and can be completed using traditional paper/pencil methods or using a computer. • Demonstrated reliability and validity.
Tool Development	Internal (unpublished) studies provide evidence of validity, reliability, and accuracy. Studies can be found at www.outpatient-screen.com
General Notes:	<ul style="list-style-type: none"> • The OPS is a computerized assessment that provides clinicians with a printed report that included percentile scores, risk classification, and item responses. • Test can be administered individually or in a group setting. • Additional information about the OPS can be found at www.outpatient-screen.com
